The Memory Hierarchy

15-213: Introduction to Computer Systems
11th Lecture, October 4, 2016

Instructor:

Phil Gibbons

Today

- **Storage technologies and trends**
- Locality of reference
- Caching in the memory hierarchy

Random-Access Memory (RAM)

- **Key features**
  - RAM is traditionally packaged as a chip.
  - Basic storage unit is normally a cell (one bit per cell).
  - Multiple RAM chips form a memory.

- **RAM comes in two varieties:**
  - SRAM (Static RAM)
  - DRAM (Dynamic RAM)

SRAM vs DRAM Summary

	Trans. per bit	Access time	Needs refresh?	Needs EDC?	Cost	Applications
SRAM	4 or 6	1X	No	Maybe	100x	Cache memories
DRAM	1	10X	Yes	Yes	1X	Main memories, frame buffers

Enhanced DRAMs

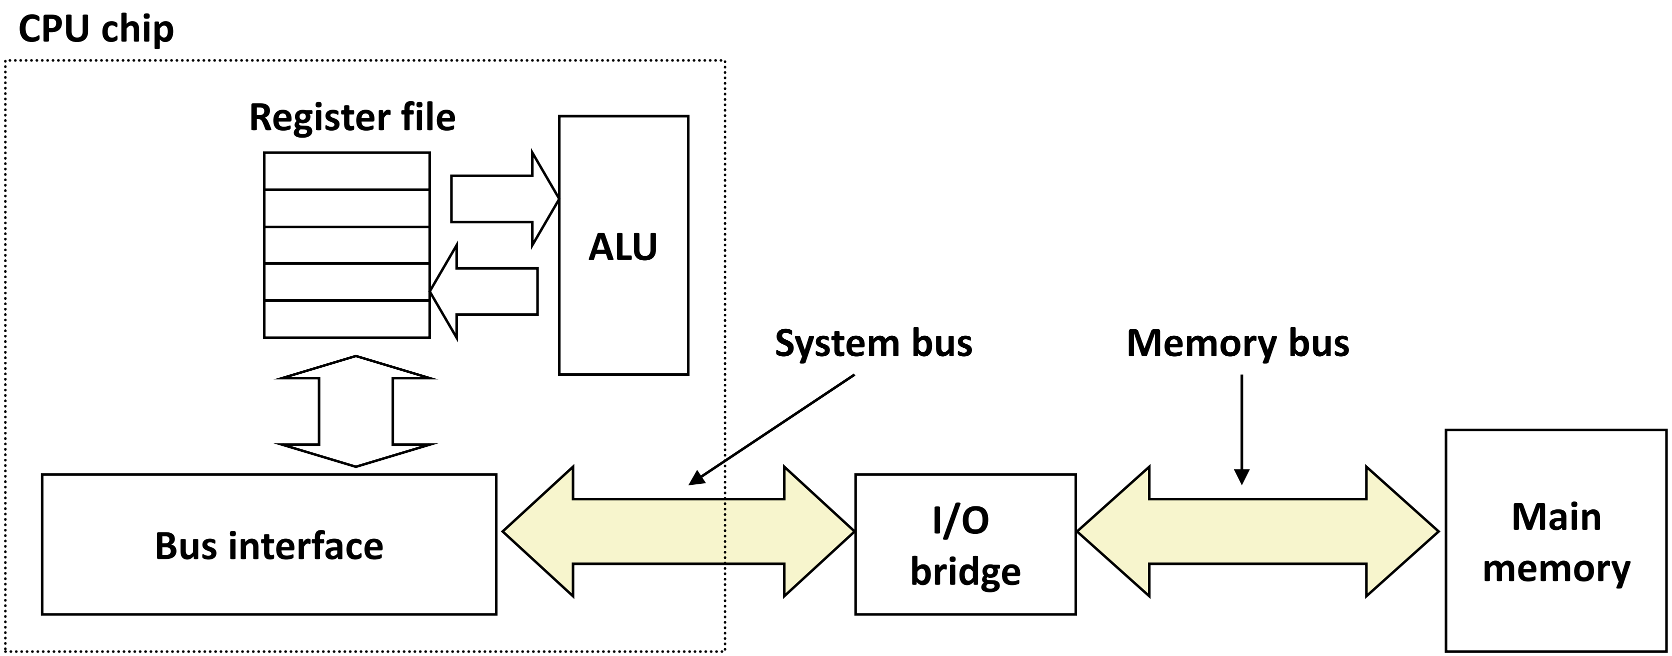
- **Basic DRAM cell has not changed since its invention in 1966.**
  - Commercialized by Intel in 1970.
- **DRAM cores with better interface logic and faster I/O :**
  - Synchronous DRAM (SDRAM)
    - Uses a conventional clock signal instead of asynchronous control
    - Allows reuse of the row addresses (e.g., RAS, CAS, CAS, CAS)
  - Double data-rate synchronous DRAM (DDR SDRAM)
    - Double edge clocking sends two bits per cycle per pin
    - Different types distinguished by size of small prefetch buffer:
      - DDR (2 bits), DDR2 (4 bits), DDR3 (8 bits)
    - By 2010, standard for most server and desktop systems
    - Intel Core i7 supports DDR3 and DDR4 SDRAM

Nonvolatile Memories

- **DRAM and SRAM are volatile memories**
  - Lose information if powered off.
- **Nonvolatile memories retain value even if powered off**
  - Read-only memory (ROM): programmed during production
  - Programmable ROM (PROM): can be programmed once
  - Eraseable PROM (EPROM): can be bulk erased (UV, X-Ray)
  - Electrically eraseable PROM (EEPROM): electronic erase capability
  - Flash memory: EEPROMs. with partial (block-level) erase capability
    - Wears out after about 100,000 erasings
- **Uses for Nonvolatile Memories**
  - Firmware programs stored in a ROM (BIOS, controllers for disks, network cards, graphics accelerators, security subsystems,…)
  - Solid state disks (replace rotating disks in thumb drives, smart phones, mp3 players, tablets, laptops,…)
  - Disk caches

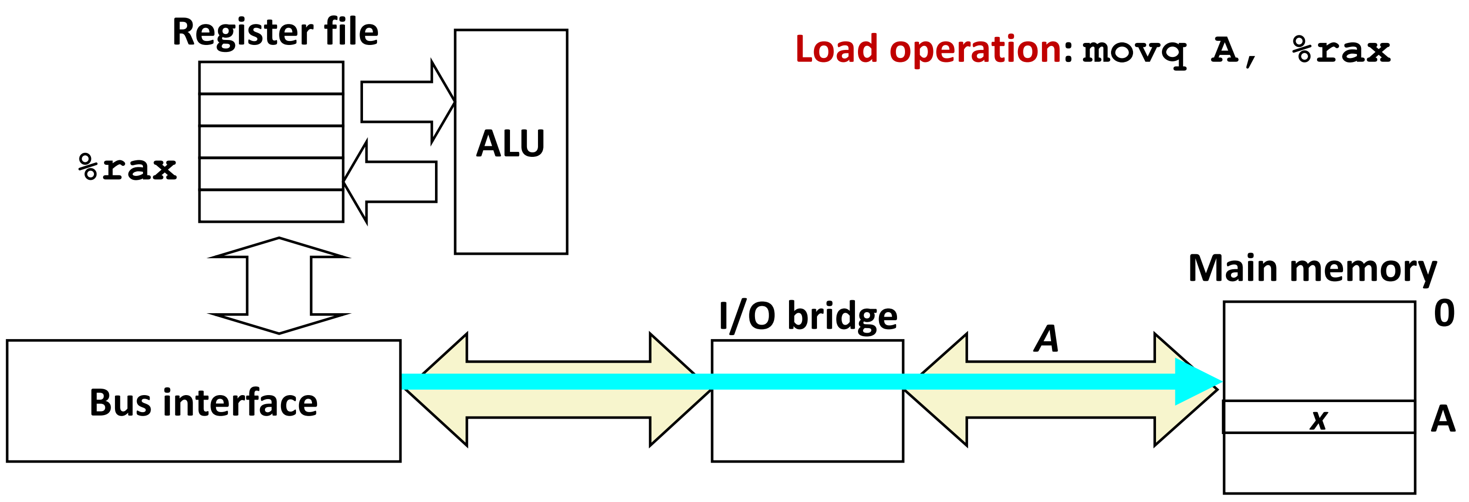
Traditional Bus Structure Connecting CPU and Memory

- A **bus** is a collection of parallel wires that carry address, data, and control signals.
- Buses are typically shared by multiple devices.



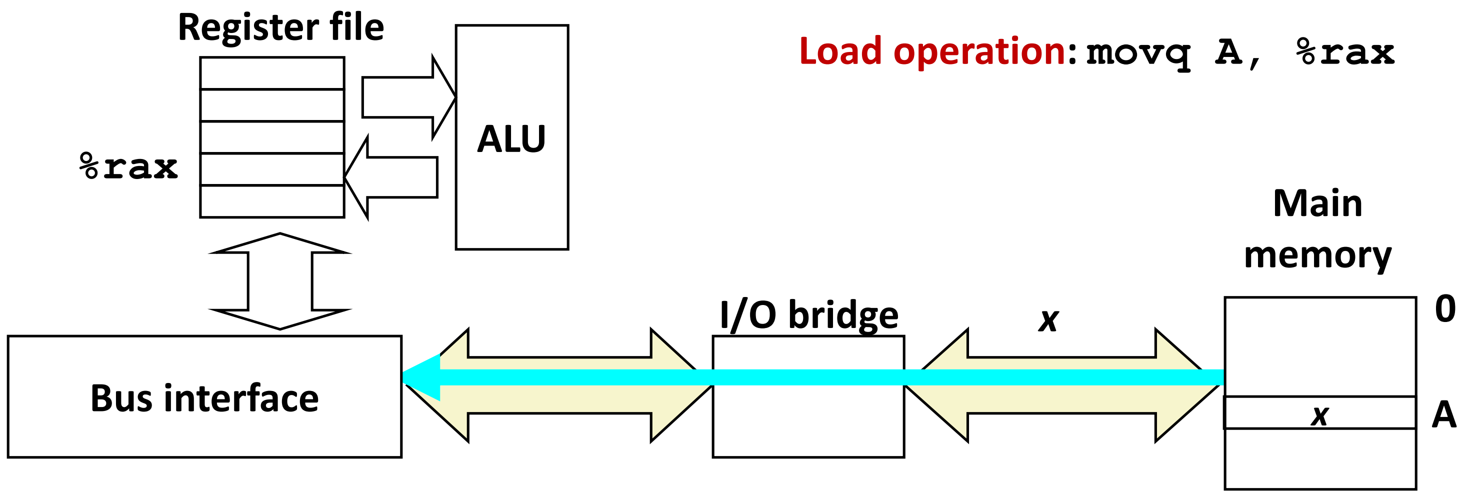
Memory Read Transaction (1)

- CPU places address A on the memory bus.



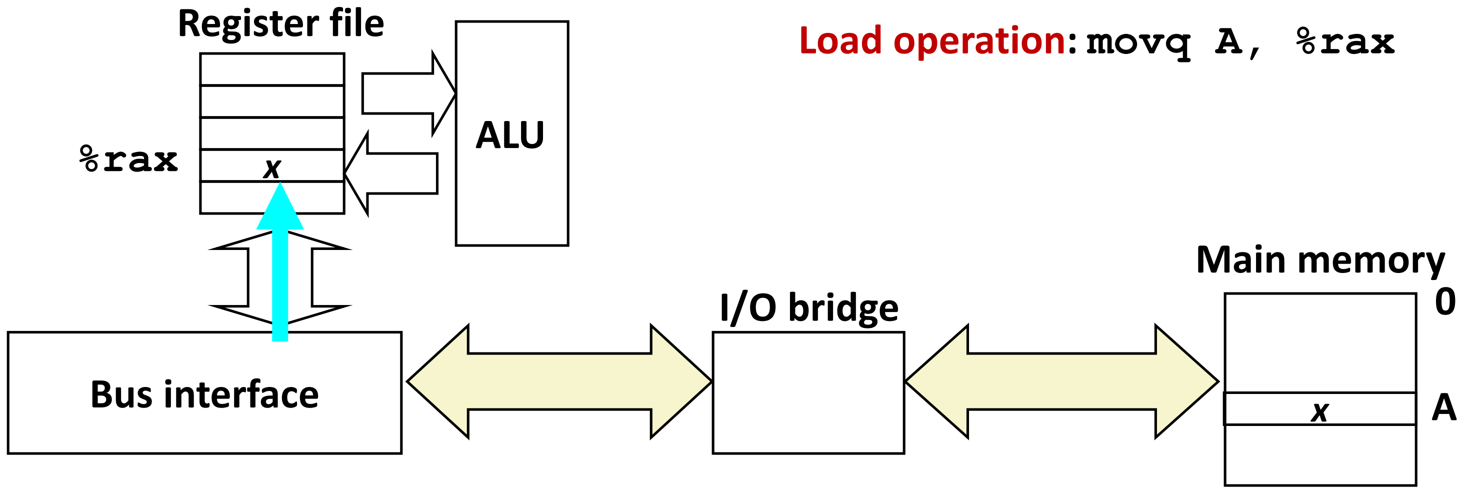
Memory Read Transaction (2)

- Main memory reads A from the memory bus, retrieves word x, and places it on the bus.



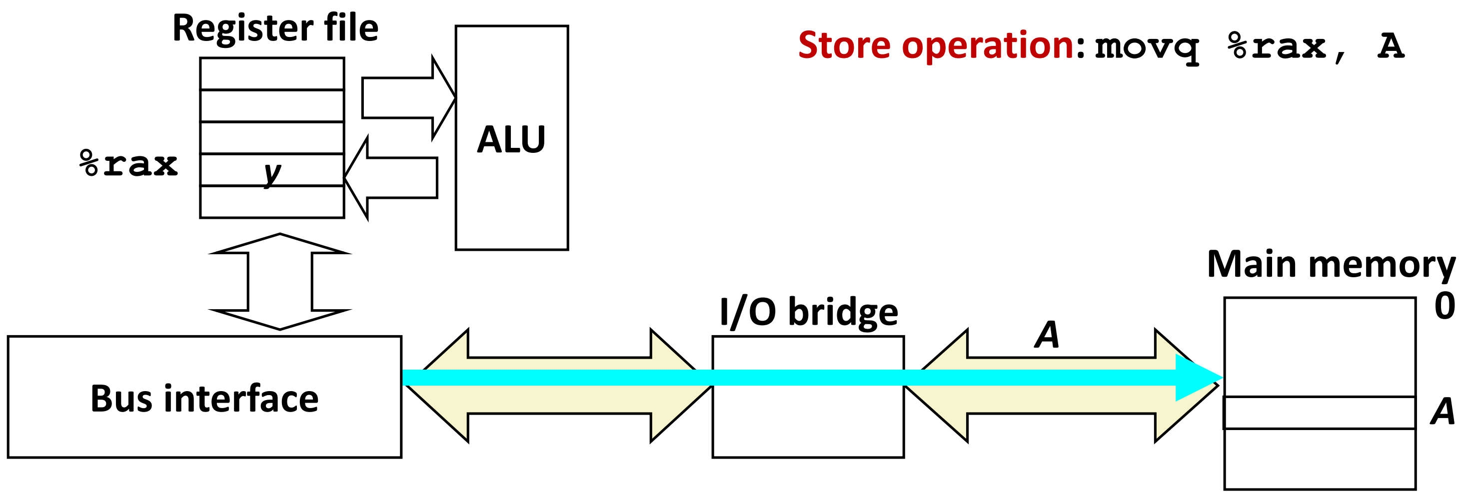
Memory Read Transaction (3)

- **CPU read word x from the bus and copies it into register %rax.**



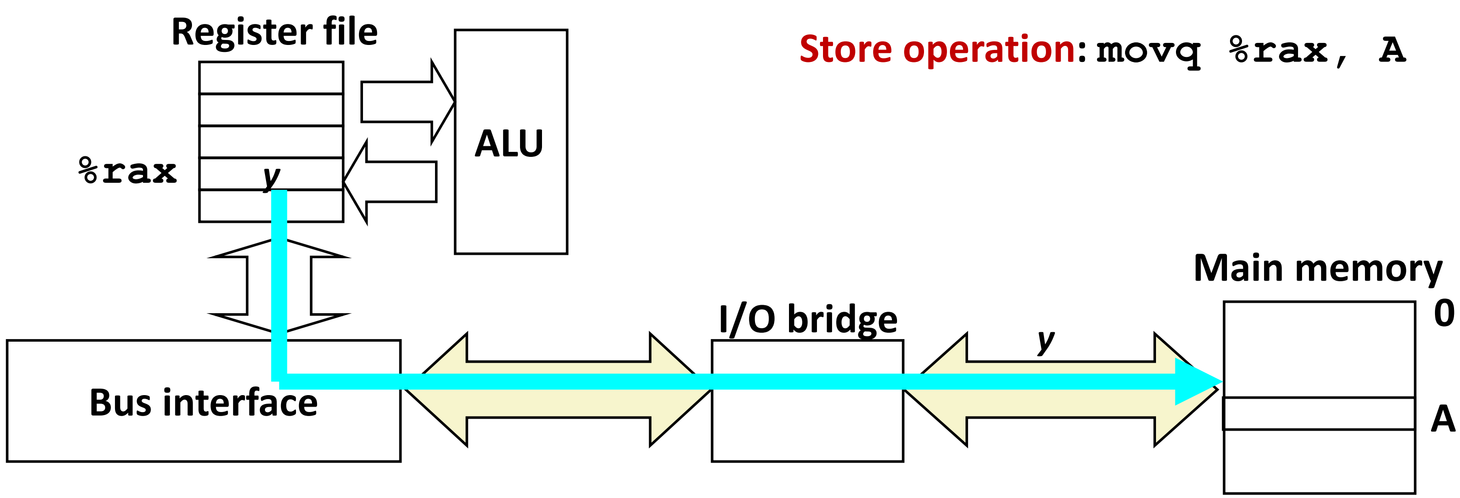
Memory Write Transaction (1)

- CPU places address A on bus. Main memory reads it and waits for the corresponding data word to arrive.



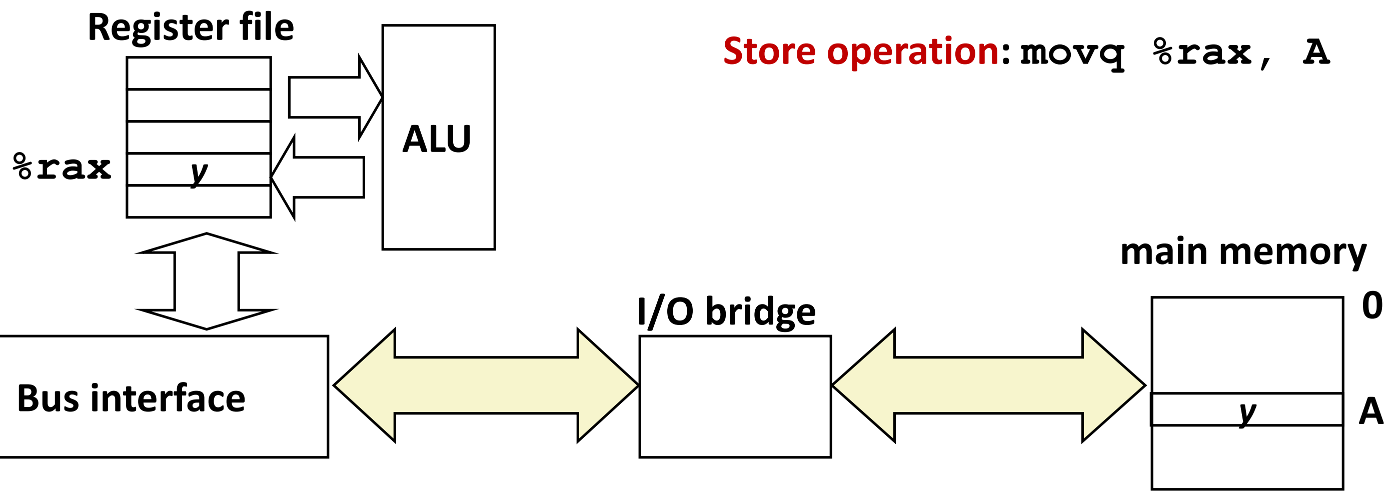
Memory Write Transaction (2)

- CPU places data word y on the bus.



Memory Write Transaction (3)

- Main memory reads data word y from the bus and stores it at address A.



What's Inside A Disk Drive?

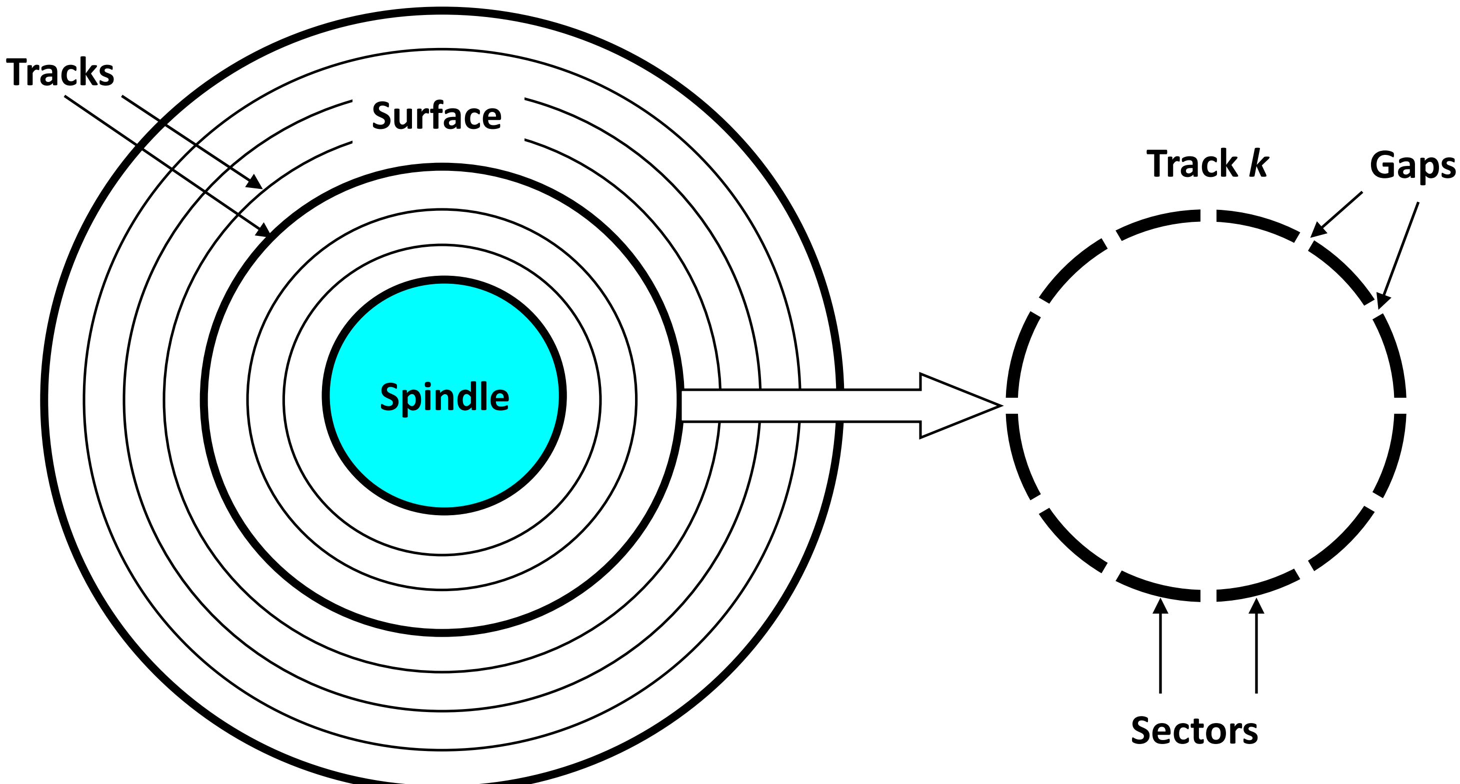
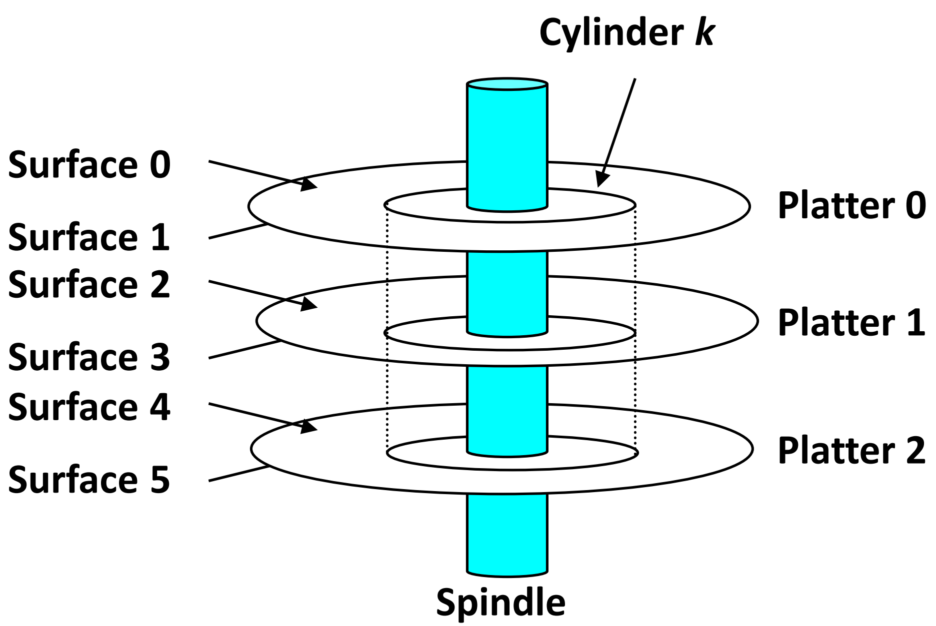
Disk Geometry

- Disks consist of **platters**, each with two **surfaces**.
- Each surface consists of concentric rings called **tracks**.
- Each track consists of **sectors** separated by **gaps**.



Disk Geometry (Multiple-Platter View)

- Aligned tracks form a cylinder.

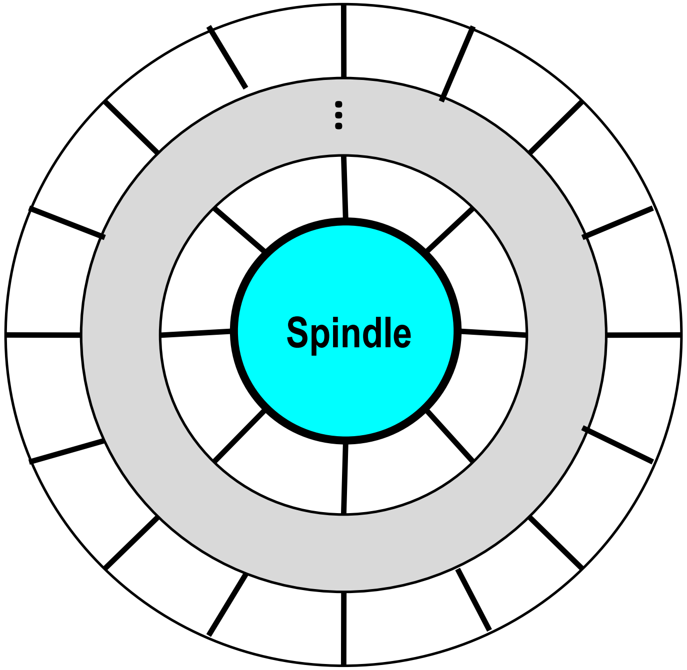


Disk Capacity

- **Capacity: maximum number of bits that can be stored.**
  - Vendors express capacity in units of gigabytes (GB), where 1 GB = 10^9 Bytes.
- **Capacity is determined by these technology factors:**
  - Recording density (bits/in): number of bits that can be squeezed into a 1 inch segment of a track.
  - Track density (tracks/in): number of tracks that can be squeezed into a 1 inch radial segment.
  - Areal density (bits/in^2): product of recording and track density.

Recording zones

- **Modern disks partition tracks into disjoint subsets called recording zones**
  - Each track in a zone has the same number of sectors, determined by the circumference of innermost track.
  - Each zone has a different number of sectors/track, outer zones have more sectors/track than inner zones.
  - So we use **average** number of sectors/track when computing capacity.



Computing Disk Capacity

Capacity = (# bytes/sector) x (avg. # sectors/track) x
(# tracks/surface) x (# surfaces/platter) x
(# platters/disk)

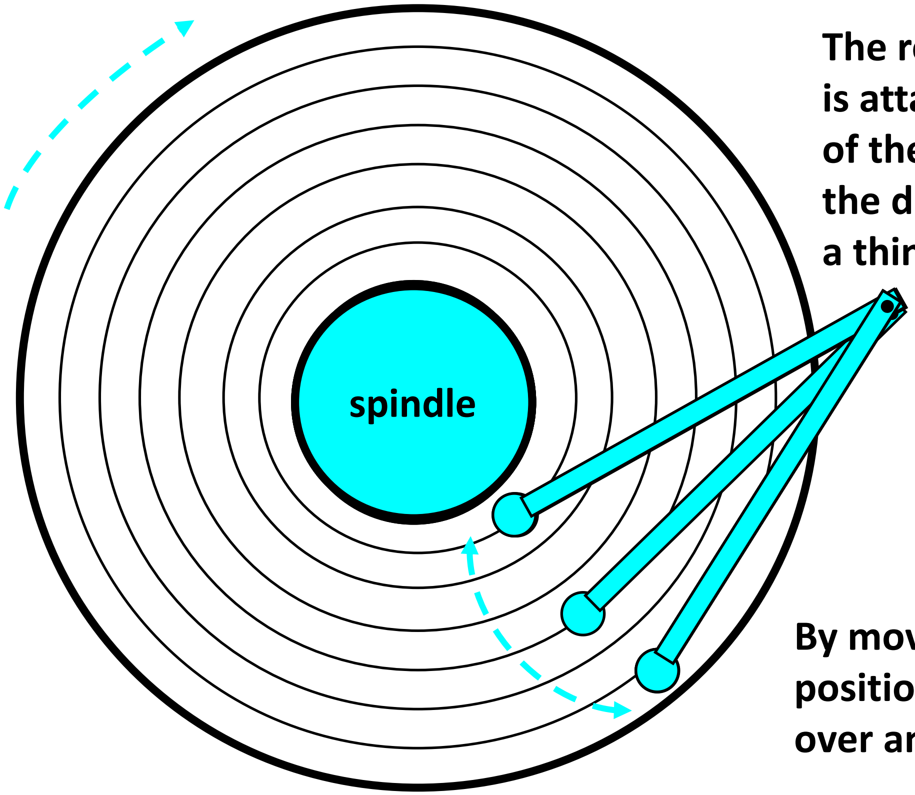
Example:

- 512 bytes/sector
- 300 sectors/track (on average)
- 20,000 tracks/surface
- 2 surfaces/platter
- 5 platters/disk

Capacity = 512 x 300 x 20,000 x 2 x 5
= 30,720,000,000
= 30.72 GB

Disk Operation (Single-Platter View)

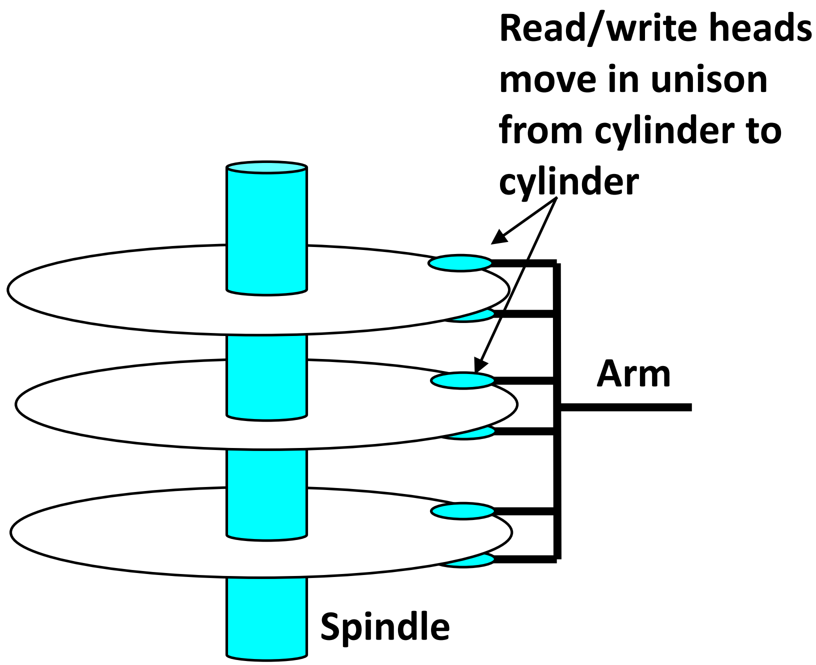
The disk surface spins at a fixed rotational rate



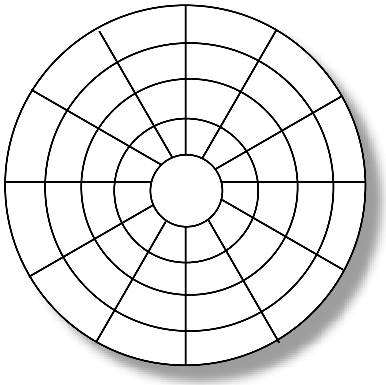
The read/write *head* is attached to the end of the *arm* and flies over the disk surface on a thin cushion of air.

By moving radially, the arm can position the read/write head over any track.

Disk Operation (Multi-Platter View)



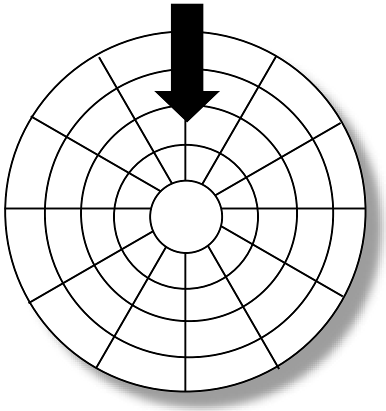
Disk Structure - top view of single platter



Surface organized into tracks

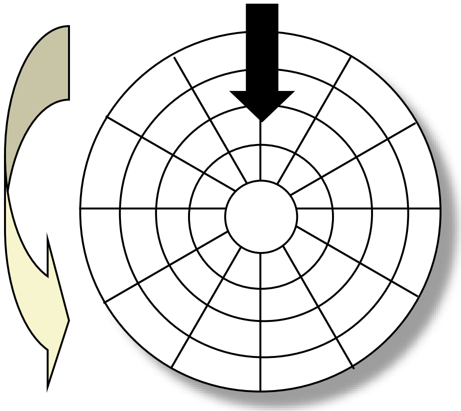
Tracks divided into sectors

Disk Access



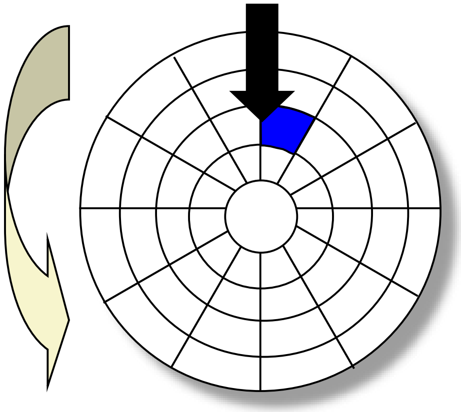
Head in position above a track

Disk Access



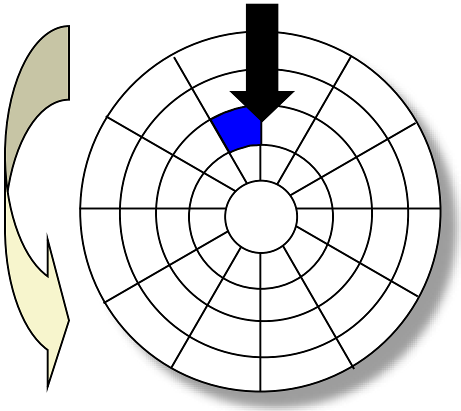
Rotation is counter-clockwise

Disk Access – Read



About to read blue sector

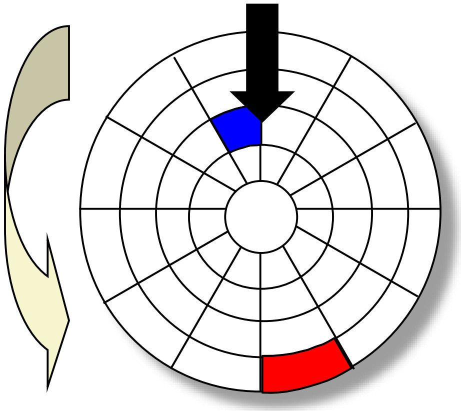
Disk Access – Read



After **BLUE** read

After reading blue sector

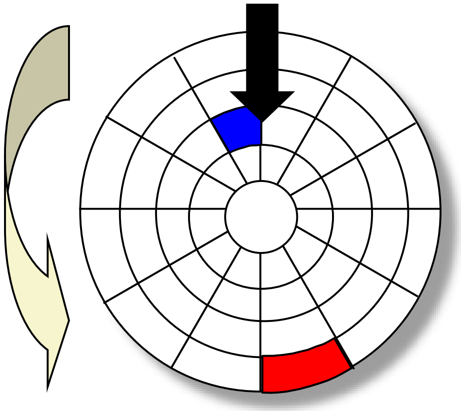
Disk Access – Read

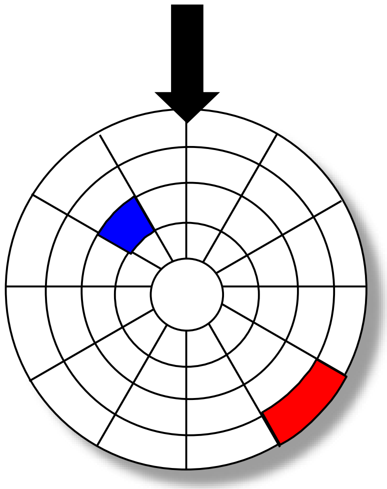


After **BLUE** read

Red request scheduled next

Disk Access – Seek



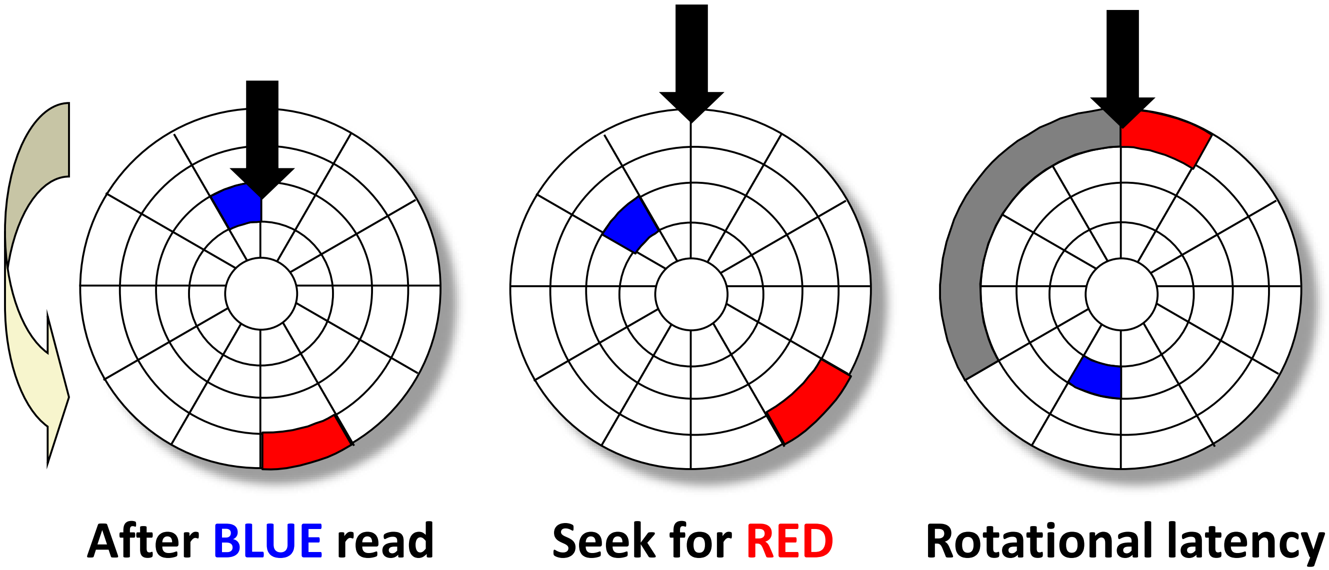


After **BLUE** read

Seek for **RED**

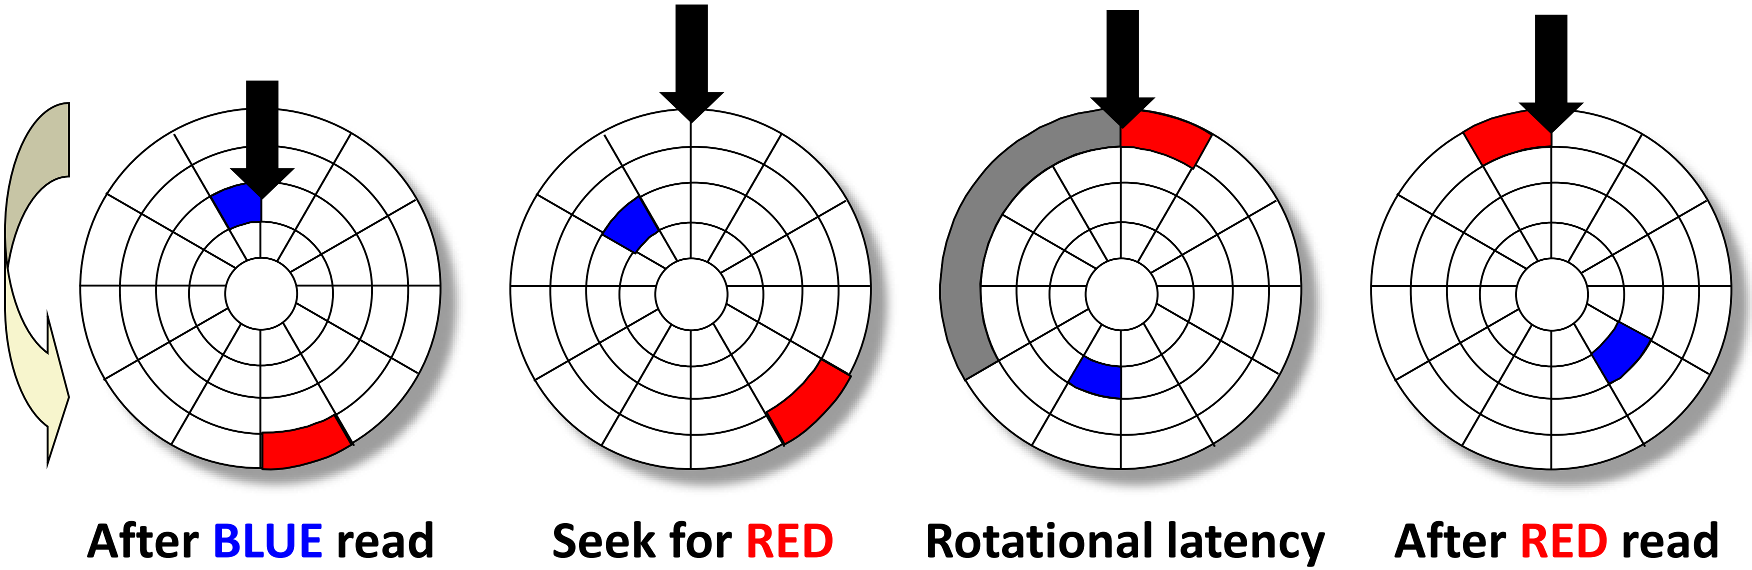
Seek to red's track

Disk Access – Rotational Latency



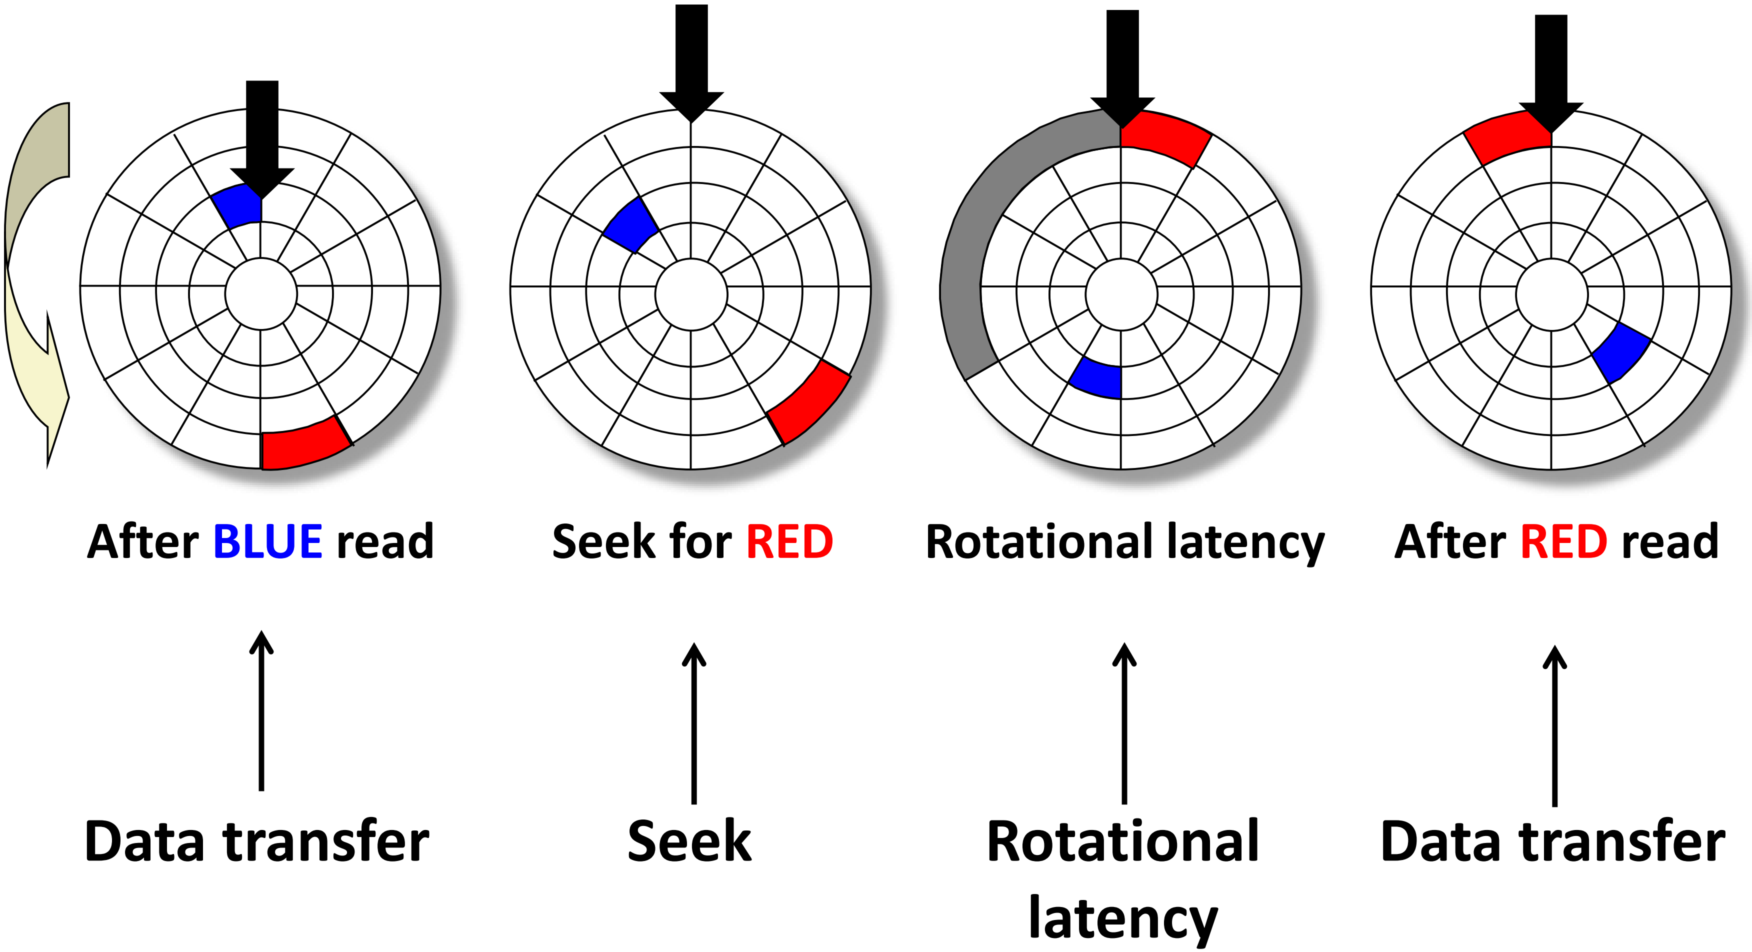
Wait for red sector to rotate around

Disk Access – Read



Complete read of red

Disk Access – Service Time Components



Disk Access Time

- **Average time to access some target sector approximated by:**
  - $T_{access} = T_{avg\ seek} + T_{avg\ rotation} + T_{avg\ transfer}$
- **Seek time ($T_{avg\ seek}$)**
  - Time to position heads over cylinder containing target sector.
  - Typical $T_{avg\ seek}$ is 3—9 ms
- **Rotational latency ($T_{avg\ rotation}$)**
  - Time waiting for first bit of target sector to pass under r/w head.
  - $T_{avg\ rotation}$ = 1/2 x 1/RPMs x 60 sec/1 min
  - Typical $T_{avg\ rotation}$ = 7,200 RPMs
- **Transfer time ($T_{avg\ transfer}$)**
  - Time to read the bits in the target sector.
  - $T_{avg\ transfer}$ = 1/RPM x 1/(avg # sectors/track) x 60 secs/1 min.

Disk Access Time Example

- **Given:**
  - Rotational rate = 7,200 RPM
  - Average seek time = 9 ms.
  - Avg # sectors/track = 400.
- **Derived:**
  - $T_{\text{avg rotation}}$ =
  - $T_{\text{avg transfer}}$ =
  - T_{access} =

- **Average time to access some target sector approximated by:**
  - $T_{\text{access}} = T_{\text{avg seek}} + T_{\text{avg rotation}} + T_{\text{avg transfer}}$
- **Seek time ($T_{\text{avg seek}}$)**
  - Time to position heads over cylinder containing target sector.
  - Typical $T_{\text{avg seek}}$ is 3—9 ms
- **Rotational latency ($T_{\text{avg rotation}}$)**
  - Time waiting for first bit of target sector to pass under r/w head.
  - $T_{\text{avg rotation}}$ = 1/2 x 1/RPMs x 60 sec/1 min
  - Typical $T_{\text{avg rotation}}$ = 7,200 RPMs
- **Transfer time ($T_{\text{avg transfer}}$)**
  - Time to read the bits in the target sector.
  - $T_{\text{avg transfer}}$ = 1/RPM x 1/(avg # sectors/track) x 60 secs/1 min.

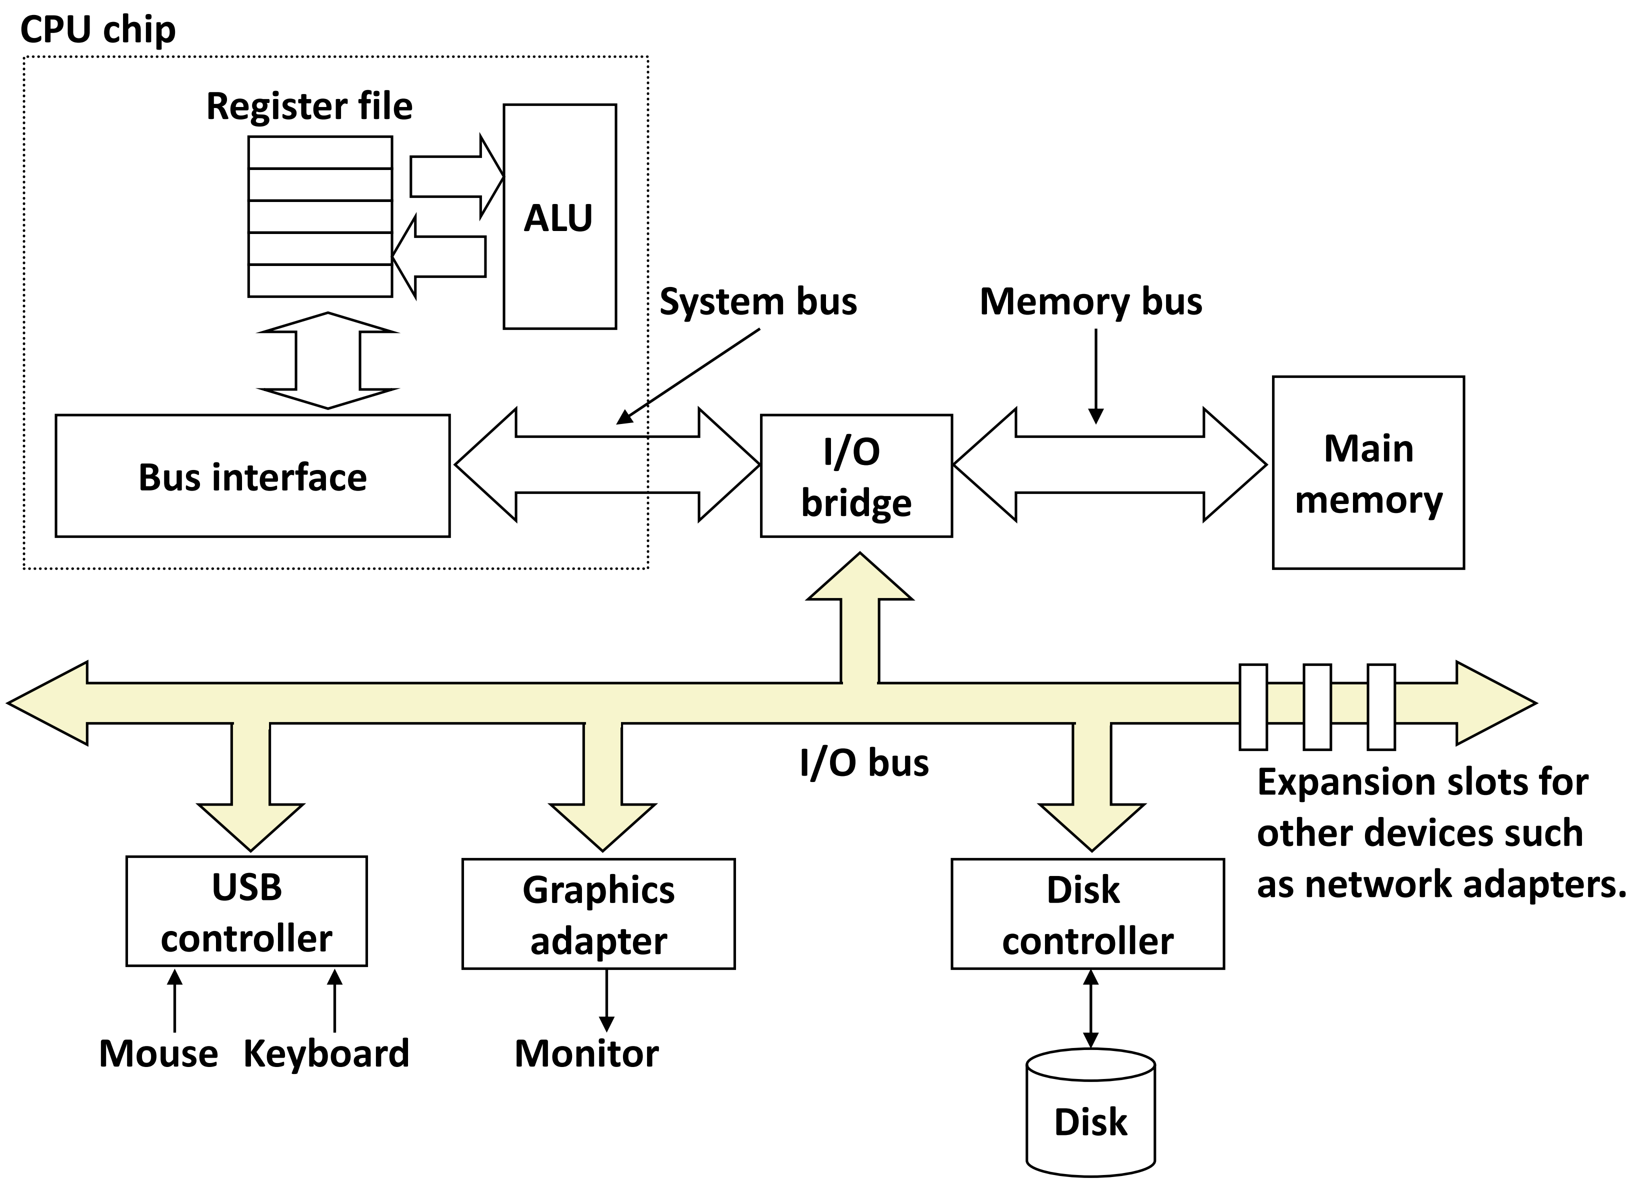
Disk Access Time Example

- **Given:**
  - Rotational rate = 7,200 RPM
  - Average seek time = 9 ms.
  - Avg # sectors/track = 400.
- **Derived:**
  - $T_{avg\ rotation}$ = 1/2 x (60 secs/7200 RPM) x 1000 ms/sec = 4 ms.
  - $T_{avg\ transfer}$ = 60/7200 RPM x 1/400 secs/track x 1000 ms/sec = 0.02 ms
  - T_{access} = 9 ms + 4 ms + 0.02 ms
- **Important points:**
  - Access time dominated by seek time and rotational latency.
  - First bit in a sector is the most expensive, the rest are free.
  - ***SRAM access time is about 4 ns/doubleword, DRAM about 60 ns***
    - ***Disk is about 40,000 times slower than SRAM,***
    - ***2,500 times slower then DRAM.***

Logical Disk Blocks

- **Modern disks present a simpler abstract view of the complex sector geometry:**
  - The set of available sectors is modeled as a sequence of b-sized logical blocks (0, 1, 2, ...)
- **Mapping between logical blocks and actual (physical) sectors**
  - Maintained by hardware/firmware device called disk controller.
  - Converts requests for logical blocks into (surface,track,sector) triples.
- **Allows controller to set aside spare cylinders for each zone.**
  - Accounts for the difference in “formatted capacity” and “maximum capacity”.

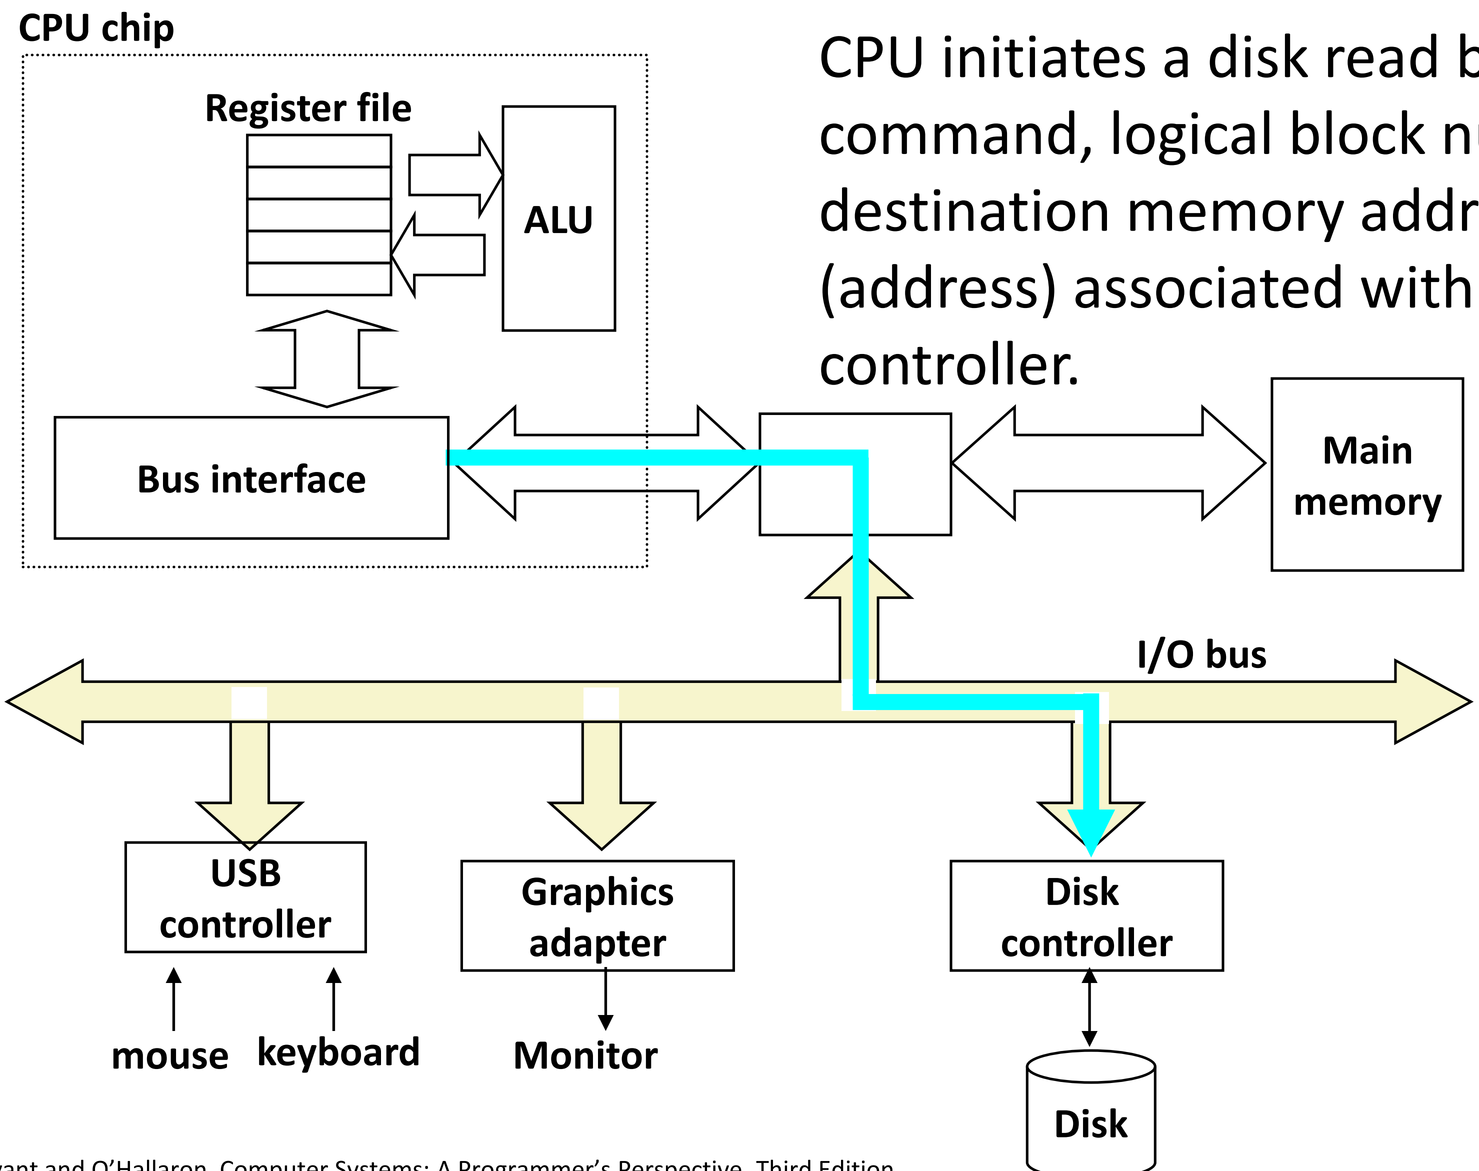
I/O Bus



CPU chip
Register file
ALU
System bus
Memory bus
Bus interface
I/O bridge
Main memory
I/O bus
Expansion slots for other devices such as network adapters.
USB controller
Graphics adapter
Disk controller
Mouse
Keyboard
Monitor
Disk

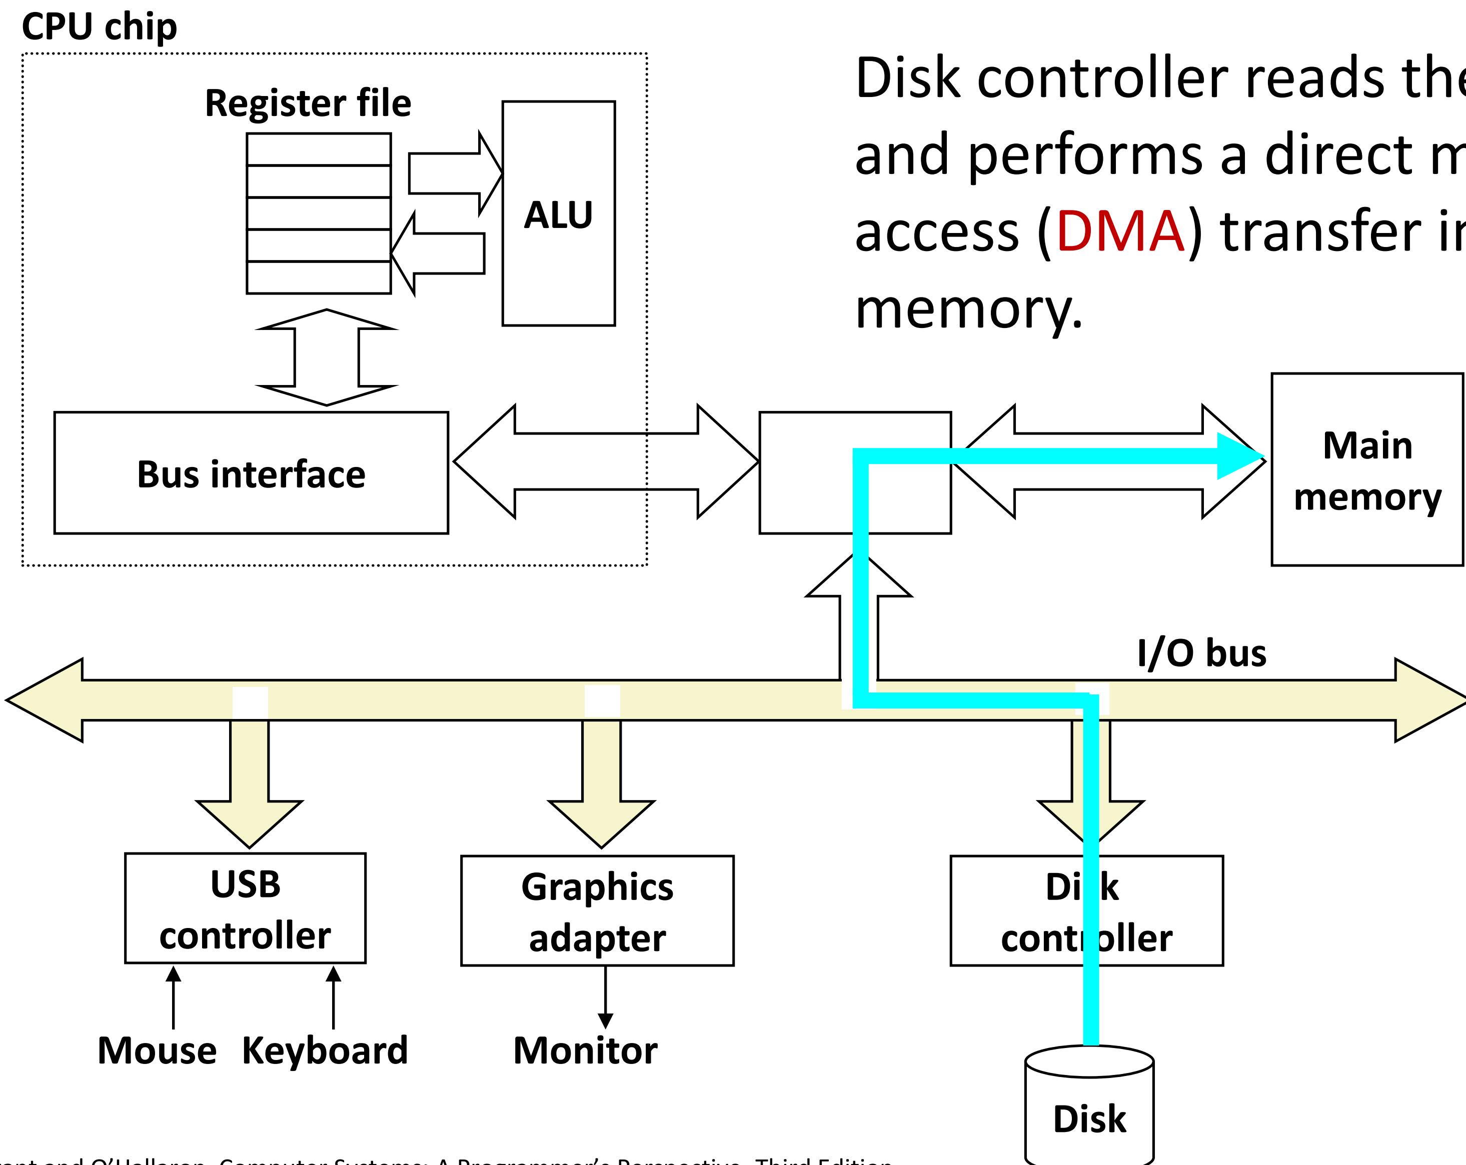
Reading a Disk Sector (1)

CPU initiates a disk read by writing a command, logical block number, and destination memory address to a port (address) associated with disk controller.



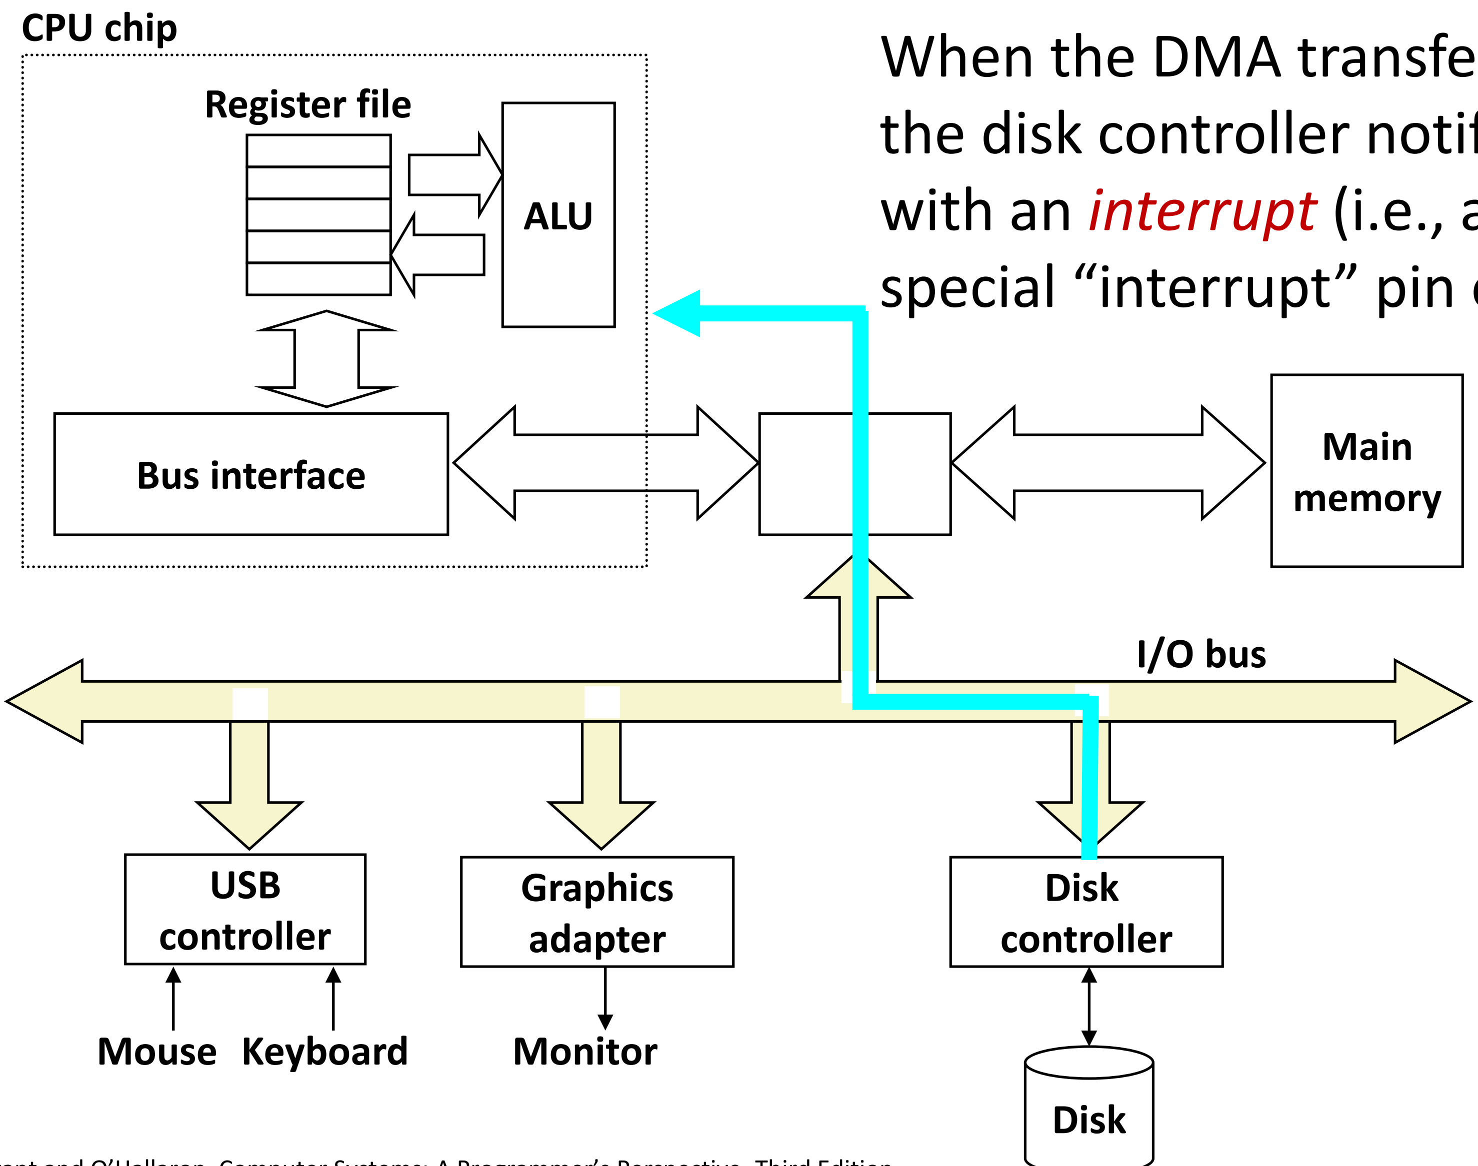
Reading a Disk Sector (2)

Disk controller reads the sector and performs a direct memory access (DMA) transfer into main memory.

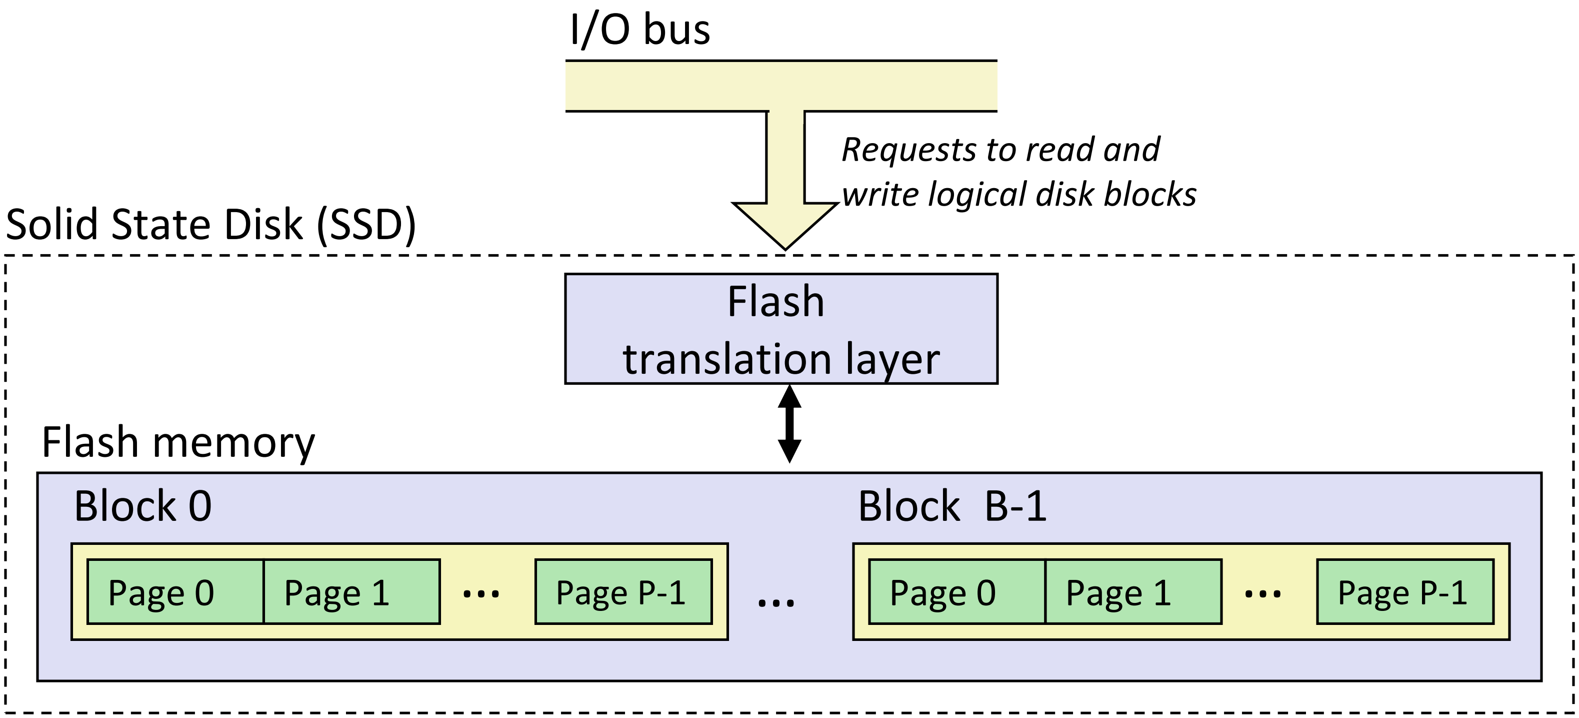


Reading a Disk Sector (3)

When the DMA transfer completes, the disk controller notifies the CPU with an *interrupt* (i.e., asserts a special "interrupt" pin on the CPU)



Solid State Disks (SSDs)



- **Pages: 512KB to 4KB, Blocks: 32 to 128 pages**
- **Data read/written in units of pages.**
- **Page can be written only after its block has been erased**
- **A block wears out after about 100,000 repeated writes.**

SSD Performance Characteristics

Sequential read tput	**550 MB/s**	**Sequential write tput**	**470 MB/s**
Random read tput	**365 MB/s**	**Random write tput**	**303 MB/s**
Avg seq read time	**50 us**	**Avg seq write time**	**60 us**

- **Sequential access faster than random access**
  - Common theme in the memory hierarchy
- **Random writes are somewhat slower**
  - Erasing a block takes a long time (~1 ms)
  - Modifying a block page requires all other pages to be copied to new block
  - In earlier SSDs, the read/write gap was much larger.

Source: Intel SSD 730 product specification.

SSD Tradeoffs vs Rotating Disks

- **Advantages**
  - No moving parts → faster, less power, more rugged
- **Disadvantages**
  - Have the potential to wear out
    - Mitigated by “wear leveling logic” in flash translation layer
    - E.g. Intel SSD 730 guarantees 128 petabyte (128×10^{15} bytes) of writes before they wear out
  - In 2015, about 30 times more expensive per byte
- **Applications**
  - MP3 players, smart phones, laptops
  - Beginning to appear in desktops and servers

The CPU-Memory Gap

The gap *widens* between DRAM, disk, and CPU speeds.
